Semantic model for Certificate of Analysis for Asphalt Plant Samples

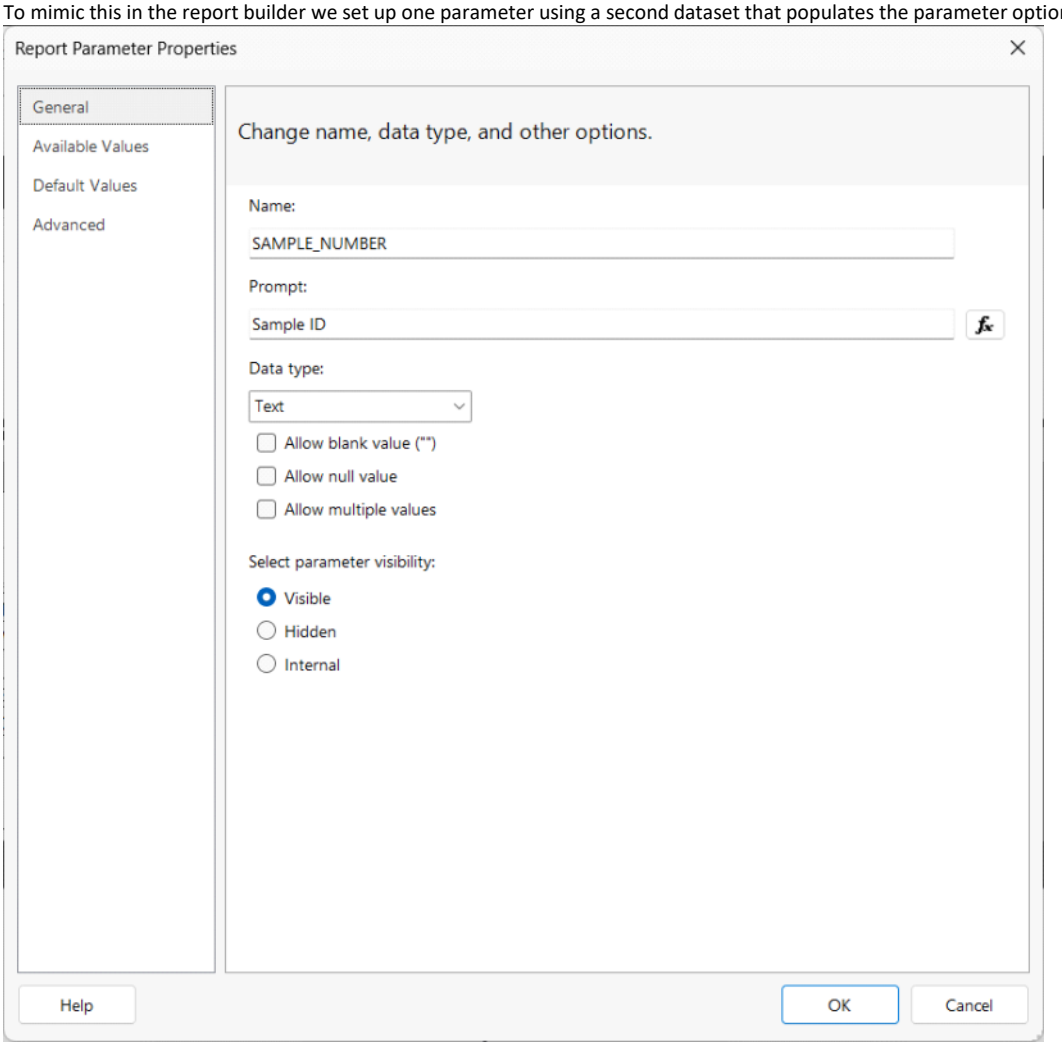

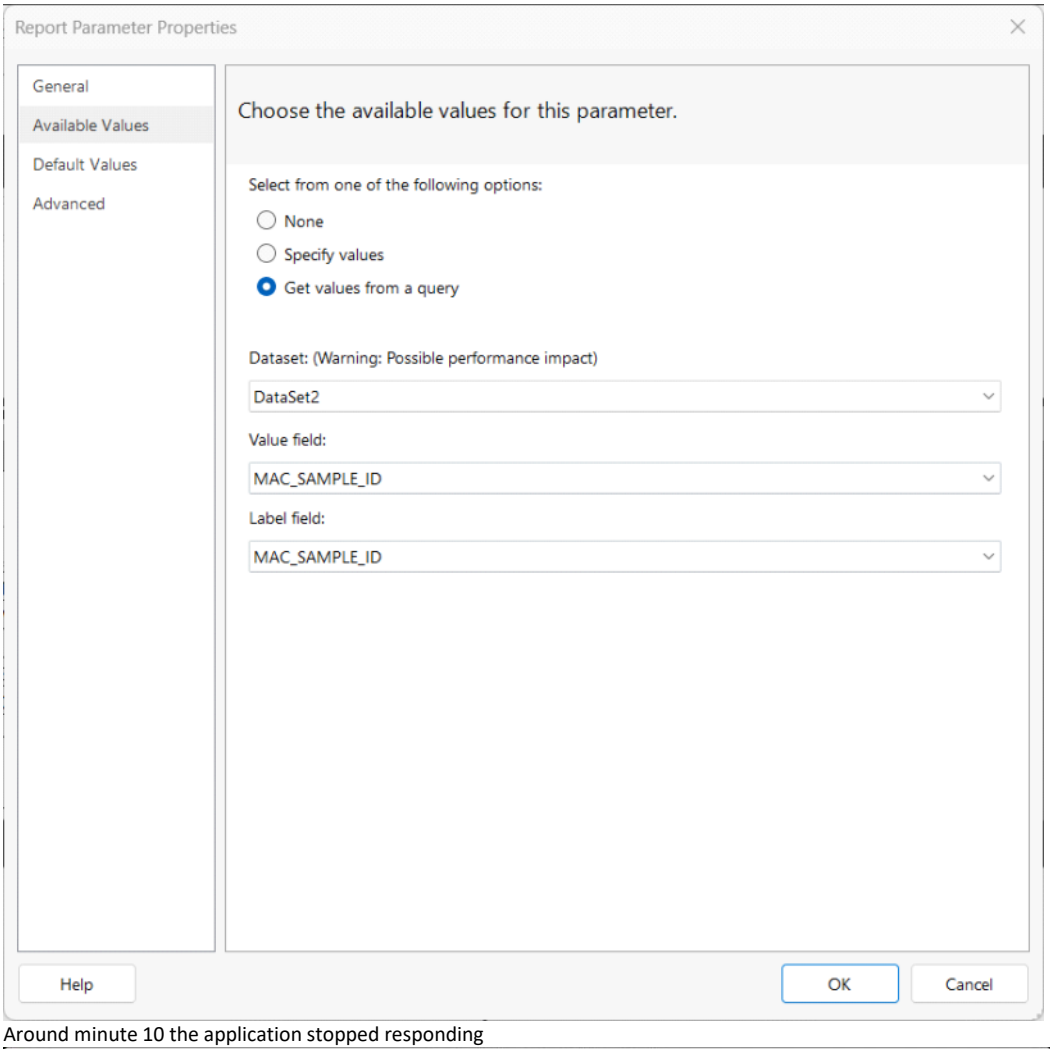

The previous semantic model was published to one of our workspaces and subsequently used as our data source for this paginated report in the Power BI Report Builder tool.

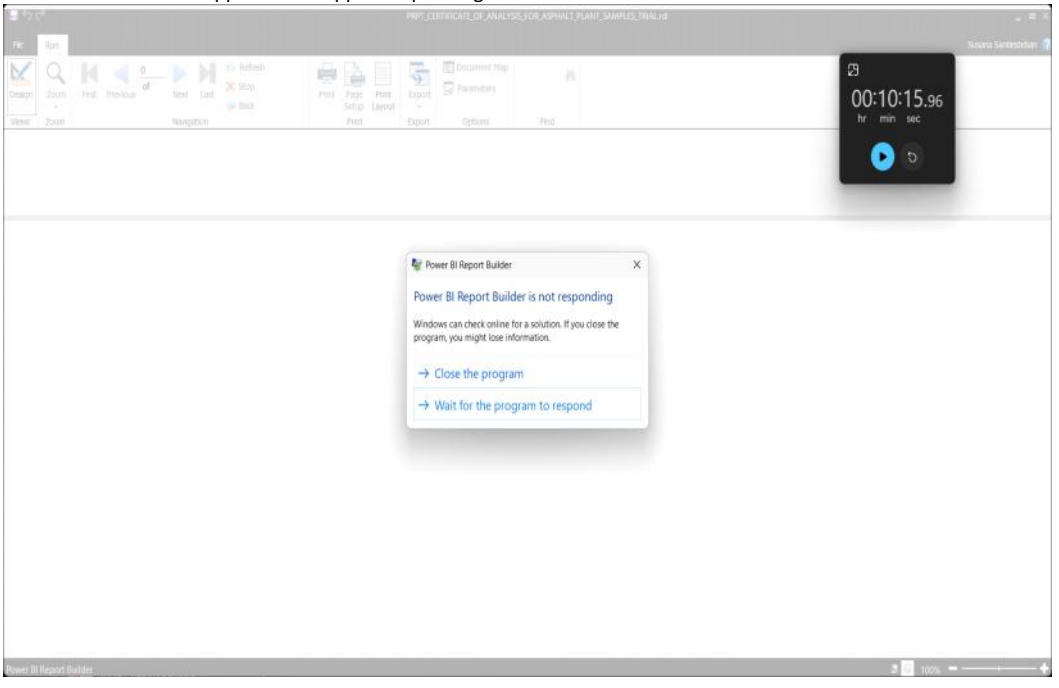

This report is modeled like the current version uploaded into our enterprise application. Note it is imperative that the user can search for any of the 2+mil sample IDs and be able to preserve the functionality in the enterprise application of typing to search.

To mimic this in the report builder we set up one parameter using a second dataset that populates the parameter options.

Around minute 10 the application stopped responding

In prior test runs of the report I also received this error:
'Unexpected end of file while parsing Name has occurred. Line 1, position 134909198.'
